

Dear toilet user,

Please note that clogging the toilet while core-dumping is considered harmful. Whatever you do in this cubicle should be done using non-blocking I/O.

UCL's shInternet Service Provider caps the download rate at 2 MegaButts per second, and exceeding this limit violates their Fair Poosage Policy. Unix pipes can only read a small amount of data at a time, so to avoid overwhelming them please *flush the buffer twice*—once before wiping your disk, and once afterwards.

I understand that network congestion can sometimes be a problem. If you often find that emptying your cache is causing a stack overflow, I would recommend adding *fiber optic technology* to your diet. Fiber has been shown to greatly increase data transmission rates and causes less noise on the line.

I would recommend raisins, prunes or dates. (We all know that computer scientists need to get more dates anyway).

I hope you have enjoyed these puns whilst flexing your buns.
